Rate Design

- ❖ The *structure* of prices
 - ❖ That is, the form and periodicity of prices for a firm's goods and services
 - ❖ Usage-Based
 - ❖ fixed, recurring charges
 - ❖ Installation, Hook-up and Exit Fees
- ❖ Simple Rate Designs
 - ❖ $\text{Price} = \text{Rev. Req.} / \text{Customers}$
 - ❖ $\text{Price} = \text{Rev. Req.} / \text{Sales}$

Objectives of Rate Design

- ❖ Revenue-Related Objectives:
 - ❖ Rates should yield the total revenue requirement
 - ❖ Rates should provide stable and predictable revenues
 - ❖ The rates themselves should be stable and predictable

Objectives of Rate Design (*continued*)

- ❖ Cost-Related Objectives
 - ❖ Rates should be set so as to promote economically-efficient consumption (static efficiency)
 - ❖ Rates should reflect the present and future private and social costs (and benefits) of providing service
 - ❖ Costs should be apportioned fairly among customers and customer classes

Objectives of Rate Design (*continued*)

- ❖ Cost-Related Objectives (cont.)
 - ❖ Undue Discrimination should be avoided
 - ❖ Rates should promote innovation in supply and demand (dynamic efficiency)
- ❖ Practical Considerations:
 - ❖ A rate design should be, to the extent possible, simple, understandable, acceptable to the public, and easily administered

Objectives of Rate Design (*continued*)

- ❖ The objectives of rate design are, in effect, the objectives of regulation
- ❖ The objectives of rate design are, sometimes, in conflict with each other

Revenue-Related Issues

- ❖ Rates set should be set so as to give a regulated firm a reasonable opportunity to
 - ❖ recover prudently incurred expenses, including investment, and
 - ❖ to earn a fair rate of return on the remaining costs (the undepreciated portion) of its prudent investment

Revenue-Related Issues (*continued*)

- ❖ Rates set in this way enable a company to cover its debt service obligation, pay dividends to shareholders, and attract new capital investment

Cost-Related Issues

- ❖ Will rates set at average cost per unit be economically efficient?
 - ❖ Average cost vs. marginal cost
 - ❖ Long run vs. short run
- ❖ Private financial vs. total social cost
 - ❖ Cost of environmental damage from electricity production and delivery
- ❖ Who pays what costs?
 - ❖ The principle of cost causation

The Price Signal

- ❖ The price of a good should reflect the full cost of the resources needed to produce the good.
- ❖ Long-run vs. short-run cost of production?

Cost Allocation

- ❖ Based on groups of customers
 - ❖ Customer classes designated according to the criterion adopted (value, cost, social objectives)
 - ❖ Residential (with or without a low income or elderly segment)
 - ❖ Commercial
 - ❖ Industrial
 - ❖ Street lighting
 - ❖ Agricultural

Allocating Costs

- ❖ Include line losses
- ❖ Types of Demand Measures
 - ❖ Individual Peak
 - ❖ Class Peak
 - ❖ Coincident Peak
 - ❖ Annual
 - ❖ Monthly
 - ❖ Average and Excess

Two Types of Cost Studies

- ❖ Embedded or Fully Allocated Cost Study
 - ❖ Uses capital and operating costs that have been historically embedded (spent, sunk, or invested)
 - ❖ Built on accounting cost data generated in the day-to-day operations of the utility
- ❖ Incremental or Marginal Cost Study
 - ❖ The cost of providing additional service
 - ❖ forward-looking study of resource costs

Embedded Cost Allocation

- ❖ Most simple design
 - ❖ $\text{\$Rev Req} \div \text{Number of customers} = \text{Rate, billed annually, semi-annually or quarterly}$
 - ❖ Complexities arise due to desire to distinguish between
 - ❖ Types and amount of service
 - ❖ Types of customers

Fully Allocated Embedded Costs

- ❖ Advantages:
 - ❖ Actual costs
 - ❖ Reconciled with the revenue requirement
 - ❖ Perceived as Fair
- ❖ Disadvantages:
 - ❖ Allocating joint and common costs
 - ❖ Does not reflect current market trends
 - ❖ May produce inefficient prices

Categorize

- ❖ What are the costs of
 - ❖ Generation
 - ❖ Transmission
 - ❖ Distribution
 - ❖ Billing
- ❖ Need fairly detailed accounting for planning & rate design

Functionalize

- ❖ Energy
- ❖ Peak Demand
- ❖ Customers

Marginal Cost Pricing

- ❖ Equal to the economic costs of providing the next increment of service
 - ❖ Long-run v. Short-term
 - ❖ Advantages: forward looking, economic costs
 - ❖ Disadvantages
 - ❖ Definitions more contentious
 - ❖ Reconciliation with rev. req.
 - ❖ Requires forecasted demand and costs
 - ❖ Potential volatility

Marginal Cost Pricing

- ❖ Promotes economic efficiency
 - ❖ Exception: The problem of "second best"
- ❖ Those who cause the costs pay the costs
- ❖ No undue discrimination
- ❖ Challenge:
 - ❖ Will pricing at marginal cost cause the utility's to collect its revenue requirement? Will it over-collect, or under-collect?

Calculating Marginal Costs

- ❖ What is the appropriate increment of output, or margin, to measure?
 - ❖ Generating capacity costs: \$/kw-yr
 - ❖ Energy costs: \$/kwh
 - ❖ T&D costs: \$/kw-yr
- ❖ Avoided costs

Marginal-Cost Pricing and the Revenue Requirement

- ❖ Reconciling marginal-cost prices with the revenue requirement
 - ❖ Relationship of the rev.req. (total cost) to marginal cost
- ❖ What kinds of pricing distortions are acceptable?
- ❖ Should the incremental costs of environmental damage be reflected in rates?

Cost Allocation

- ❖ Are all classes equally risky to serve?
- ❖ Cross-subsidies between classes
- ❖ Cross-subsidies within classes

Gradualism

- ❖ If subsidies exist, how quickly do you try to eliminate them
- ❖ Rate shock -- irate ratepayers
- ❖ Impact on low-income consumers
- ❖ Public Policy Consideration
 - ❖ Industrial development
 - ❖ Protection of residential consumers

Joint and Common Costs

- ❖ Weakness of Embedded Costs
- ❖ Unallocable Costs
 - ❖ Administrative and General Costs
- ❖ "Solutions"
 - ❖ Allocate in proportion to allocable
 - ❖ Do something reasonable
 - ❖ Consider other policy goals

Rate Averaging

- ❖ Within rate classes
- ❖ Across geographic areas: rural vs. urban
- ❖ Rate averaging vs. subsidy vs. simplicity

Social Value of Service Pricing

- ❖ Assistance to specific customer classes
 - ❖ Residential lifeline rate
 - ❖ Economic development/business retention rates
- ❖ Promote social objectives
 - ❖ Conservation/environmental considerations
 - ❖ Universal service

Designing Tariffs

- ❖ After allocation to customer classes, the costs still must be set into tariffs
- ❖ Tariff development also considers goals of the tariffs

Primary Tariff Cost Components

- ❖ Customer Charge – Flat rate
 - Recover fixed charges
- ❖ Usage component
- ❖ Demand component
- ❖ Interaction of these components sends price signals

Rate Forms

Flat Rates

Decreasing Block Rates

Increasing Block Rates

Seasonal Rates

Usage Patterns

❖ Flat

❖ Declining Block

- Based upon assumption that cheaper to serve large customers
- And that marginal cost is less than average cost
- Encourages consumption, discourages conservation, so important to ensure prices are right

Usage Patterns (cont'd)

- ❖ Inverted Block
 - Marginal cost greater than average cost
 - Discourages consumption – encourages conservation
 - Lifeline rate
- ❖ Peak/Off-peak rates
 - water heater discounts
- ❖ Seasonal rates
- ❖ Real-time pricing

Demand component

- ❖ Reflects fact that utility must have power available to serve customer
 - (i.e., capacity charges)
- ❖ Encourages reduced usage at peak periods (load shifting)

Tariff Design

❖ Uniform tariffs

- Easier to administer
- Social benefits of ensuring connectivity
- For most customers,
- Accompanied by line extension policies that require customer to pay much of cost of new extensions

Customer-Specific Tariffs

- ❖ Actual customer cost-based tariffs
 - More precise (assuming can identify separate costs)
 - Generally not used in Vermont and most of US (except where customer has very clear distinguishing characteristics)
 - Difficult to calculate
 - ◆ What are the cost differences in an integrated electrical system?
 - ◆ for most customers, costs outweigh benefits

Special Contracts

- ❖ Customers with unique cost causing characteristics
- ❖ Economic Development, load or job retention
- ❖ Problem: selling power below cost yields inefficient use of resources and financially weak utilities
- ❖ Where not unique or where categorization possible, tariffs preferred
