General Session

Strategies for Expediting Power Line Transmission and Gas Pipeline Siting
Moderator: Hon. Ted Thomas, AR

Kristi Wise, Burns & McDonnell
James Nicholas, CH2M
Joan Dreskin, General Counsel INGAA
James Haggerty, USACE
Carl Zichella, NRDC
Transmission Line Routing Goals

► Find an acceptable route:

• Environmentally Acceptable
  ► Minimize impacts to wetlands, protected species, streams, conservation easements, state/federal lands, and minimize permitting needs for these resources

• Acceptable to the Public
  ► Minimize impacts to homes, businesses, public facilities, parcels, cropland, cultural resources, visual, airports

• Acceptable to Engineers
  ► Cost (length, angles)
  ► Schedule
  ► Constructability / reliability / accessibility
  ► Feasible

► Process needs to be effective, efficient, defensible (expect litigation)
BMcD Routing Process Objectives

- Involve both expert judgment and quantifiable analysis to minimize both subjectivity and bias
- Follow applicable state utility commission routing and reporting requirements to minimize the possibility of project rejection
- Anticipate issues and concerns and address them proactively to minimize cost and schedule overruns
- Build, maintain and manage relationships with property owners, local communities, abutting property owners, civic leaders, business leaders, neighborhood associations and other stakeholders for the entire life of the project
  - Early and often communication with key stakeholders
  - Incorporate public comments and feedback into the route identification, analysis, and route selection, when feasible
- Identify routes that preserve the natural landscape and minimize conflict with present and planned uses to the extent practicable, while also considering engineering concerns
Transmission Line Routing Process

► Gather GIS and Other Data
  • Parcels, land use and land cover, existing utilities, federal, state and local lands, airports, cultural resources, development, roads, wetlands, streams, protected species habitat, irrigation systems, soils, terrain, etc.
  • Identify, classify, and map constraints
    ► Prohibitive, Restrictive, Prudent

► Contact Agencies / Community Leaders for Notification and Input

► Identify Preliminary Routes
  • Pathways that avoid as many constraints as possible
  • Identify constrained areas / hot spots
  • Identify other corridors to parallel / co-locate
  • Reasonable number of alternatives
  • Manual / Least Cost Path both used

- Field review routes along public roads, possibly also by helicopter
- Hold public open houses to gather public input
  - Study area
  - Preliminary routes
  - Selected routes
  - Make adjustments to routes based on input at each stage, if feasible
  - Become aware of possible legal challenges early in process / address proactively

- Evaluate routes
  - Select key differentiating factors (length, length parallel to existing transmission lines, houses within 300 feet, wetlands crossed, etc.)
  - Quantify potential route impacts
  - Develop impact scores to use to compare routes (defensible)
  - Incorporate landowner input into evaluation weights / intangible considerations
  - Select preferred/alternate routes to file with utility commission

- Prepare routing study report and application for utility commission
  - All states differ in some ways as to requirements for CCN (none to complex)
  - We recommend standard process even without CCN to support eminent domain and other possible litigation

- Testify
  - Defensible process
    - Third party independent of utility
    - Low subjectivity
    - Prepare complete analysis and report, having addressed all possible impacts
EPA 111b/d and Clean Water Rule Implications

- EPA 111b/d (Clean Power Plan) = more transmission, more renewables
- Clean Water Rule = potentially more permitting uncertainty
- Combined, these two proposed regulations could create a perfect storm where new construction is needed, but can’t get permitted on time
  - Anticipated wetland impacts can be determined early and avoided, but ambiguity in what is/is not a jurisdictional wetland can increase permitting costs and time to get permits
  - Increase in what is jurisdictional could result in fewer projects within NWP limits, more IP’s (more time, more money)

- Strategies for minimizing delays?
  - Amend/implement the rule with little ambiguity so potential impacts can be avoided early in process (i.e. during routing), rather than during permitting phase
  - Increase NWP limits if more waters are considered jurisdictional
James Nicholas, Electric Transmission Siting & Permitting Program Mngr. CH2M
Actors in Transmission Siting and Permitting
Who Can Affect the Schedule?

- Applicant
- Consultant
- Regulator
  - State PUC, RTO
- Permitting Agency/Consulting Agencies
  - Corps, State EPA, FWS, SHPO, Tribes,
- Public/NGO’s
**Optimizing Siting and Permitting of Electric and Natural Gas Transmission**

- **Major Time Sinks**
  - Route Selection
  - Fieldwork
  - Permitting
    - Local (relatively short)
    - State (PUC Processes 12-18 mts)
    - Tribal
    - Federal/NEPA
  - Public Involvement
  - ROW Acquisition/Condemnation
  - Design
  - Construction

</tr>
</tbody>
</table>
What Can the Consultant Influence/Control

- **Have a robust and useful siting/routing process** –
  - minimize permitting through avoidance/minimization
  - Limit land owner’s crossed to minimize ROW acquisition logistics
  - Use CRM knowledge to avoid high probability cultural areas
  - and potential land-owner and agency intervention

- **Know the state and local permitting rules**
  - Understand the hot button issues, design siting to account for them

- **Programmatic solutions with agencies** –
  - Offer and implement programmatic solutions with agencies e.g. SHPO’s for certain kinds of projects

- **Accurate, complete, high quality work**
  - Limits re-do and review cycles
What the Applicant/Developer can Control

• **Work out the details of the project as soon as possible and minimize changes (especially large & late changes)**
  - Late changes = amendments, additional filings, fieldwork, reports, reviews, more public notices and meetings

• **Early feasibility – initial routing, permit assessment, schedule** –
  - Have a good idea of what you will be facing, provides a basis for better RFPs for construction related bids etc.

• **Engage with agencies and consultants early, a team approach works very well**
  - No surprises, tell them it’s coming, find out the hot issues
  - This is likely not your only project in the area, think past the current project & built relationships and trust

• **Fund the project through to completion**
  - Sudden stops and starts kill momentum, sap agency good will, and often require significant rework

• **Fund additional review positions at state agencies** (has been tried and works well)
  - Some state agencies severely underfunded yet have heavy review workload. Utilities have provided funding for additional reviewers
Agency Considerations

• **Regulators**
  - State PUC – Refine the process, provide comment windows
  - ISO/RTO Solicitations –
    - Allow adequate time for the Applicant to prepare complete, sound responses
    - Efficient, review and selection procedure

• **Permitting Agencies/Consulting Agencies**
  - Have a clear process, designate a project manager, consider a multi-agency permitting coordinator. Coordinate efforts between agencies to avoid duplication of effort.
  - Work with the Applicant on useful programmatic agreements
  - Do not require superfluous or excess studies
  - Conduct timely, reasonable reviews, stick to statutory review times
  - Communicate with the applicant, if information is missing or additional is required, ask informally rather than restarting the review clock
  - Be clear about expectations and reasonable about the need for and scope of mitigation or compensatory requirements
  - Consider practical compliance issues when developing rules/regulations
Geographic Variability in Transmission Siting & Permitting

- **Siting & Permitting of Transmission Varies Significantly Geographically:**
  - There is no overall permitting/licensing authority to backstop the process
  - Presence of Federal Land (denser in the west than mid-west and east)
  - Tribal Issues - West and Southwest > East
  - Variability across Climate/Bio-zones
  - Scale and Distance
  - Development density
  - State PUC/No State PUC
  - State Specific Agency Rules (e.g. wetlands)
  - Local Sensitivities/hot buttons
  - Specific T&E Species

- **General Observations**
  - Siting in the west is dominated by BLM and other Federal/Tribal processes and concerns
  - Siting in the east is much less dominated by NEPA, more likely State PUC, Wetlands, dense development and T&E species driven.
  - Circles back to siting, it must be flexible
  - Condemnation rights (often based on successful issuance of a “certificate” or similar permit) are critically important in maintaining a reasonable timeframe.
Polled Several Colleagues and Clients

• Strong sense that a robust state process for siting and approving transmission lines is a distinct advantage.
  – Predictability and a known framework within which the permitting agencies and public get to participate is key.
  – States know their applicants, agencies and public well and tailor the approval process to that.

• Much less enthusiasm for a federal FERC type process – perception that this would end up being more of an onerous “process” than a useful framework for optimizing siting and permitting

• Pre-approved Energy Corridors/Designated routes?

• Applicants have to account for multiple stakeholder concerns
  – Each stake holder is operating according to their statutory self interest –
  – outcome is therefore ALWAYS a compromise, never perfect
  – Sometimes getting opposing stakeholders/agencies together fosters understanding and flexibility

• Consultants help applicants navigate through a series of competing priorities and interests to find a useful and workable solution. “A good consultant is good at balancing priorities”.
THANK YOU

Joan Dreskin,
General Counsel
Interstate Natural Gas Assn. of America
Pipelines Make It Possible

NARUC Summer Committee Meetings
July 15, 2015

Joan Dreskin
INGAA
What is the Interstate Natural Gas Association of America?

- INGAA is a trade organization that advocates regulatory and legislative positions of importance to the natural gas pipeline industry in North America.

- INGAA is comprised of 25 members, representing the majority of major interstate natural gas transmission pipeline companies in the U.S. and comparable companies in Canada.

- INGAA’s members operate approximately 200,000 miles of pipelines, and serve as an indispensable link between natural gas producers and consumers.
U.S. Natural Gas Transmission Pipelines: A Robust Infrastructure

Source: Interstate Natural Gas Association of America, Pennwell MapSearch
FERC: Interstate Natural Gas Pipelines’ Economic Federal Regulator

- Reviews and approves pipeline rates and services
- Approves the location, construction and operation of pipelines and storage facilities
- Has exclusive siting authority—does not preempt other required federal or state authorizations
- Lead agency for NEPA review and coordinates all federal authorizations
- Establishes a schedule for all federal authorizations:
  - Ensures expeditious processing of all natural gas project permits and authorizations
  - Federal authorization decisions to be issued within 90 days of FERC’s final NEPA document
  - Yet, EPAct 2005 did not provide FERC authority to enforce its schedule
- A FERC certificate grants a pipeline eminent domain authority, but a pipeline uses this authority prudently
The Interstate Natural Gas Pipeline Model Works

- Pipelines transport, but do not sell, gas
- Open access transportation and storage
- Pipelines compete for market opportunities
- Pipelines build based on firm contracts, not on speculation
- Pipelines build on incremental rates, no cross subsidization
- Pipelines typically are designed with little or no excess capacity
- Customers ensure reliability individually by taking responsibility for a portfolio of natural gas services that meets their needs
Proven Track Record of Building Pipeline Infrastructure
10,516 miles certificated between January 2005 to May 2015

Source: FERC, Office of Energy Projects
Pipeline Authorization & Construction
From Project Inception to Pipeline Construction

**Applicant Activities**

- Conduct Open Season (3-4 months)
- Hold Scoping Meetings & Prepare Resource Reports (length of study period determined by the applicant)
- Analyze Project
- Develop Study Corridor & Prepare Resource Reports
- File Application at FERC
- Approve Pre-Filing Request (at least 6 months before filing)
- Issue Draft Environmental Impact Statement (EIS)
- Issue Final EIS
- Issue Certificate Order
- Issue Notice to Proceed to Contractor
- Construction (6-18 months)*
- Construction Compliance Monitoring

**FERC Activities**

*Timeline varies by project*
Timely and Predictable Pipeline Certification Is Paramount
EPA’s Clean Power Plan Raises Concerns about the Timing of Infrastructure Development

- Generators or electric utilities will not know until 2017 or 2018, at the earliest, whether they will contract for pipeline capacity and, importantly, for how much.

- The Proposed Power Plan raises practical concerns whether the pipeline industry physically can construct needed pipeline infrastructure by 2020.

Regulatory Overview For Utility Line Activities
Regulatory Program Mission

To protect the Nation’s aquatic resources, while allowing reasonable development through fair and balanced permit decisions.

The Corps is mandated by law to protect the aquatic environment by requiring a permit for virtually all physical impacts to the Nation's waters, including coastal waters, all open waters, and wetlands.

The Corps’ goal in administering its regulatory mission is to make timely, fair, and reasonable decisions.
Corps Regulatory Authorities

- **Section 10 Rivers and Harbors Act of 1899**
  - Structures/work in, over, or under Navigable Waters or affecting the course, location, or condition of Navigable Waters

- **Section 404 Clean Water Act**
  - Discharges of Dredged or Fill Material into Waters of the United States

- **Section 103 of the Marine Protection, Research and Sanctuaries Act**
  - Regulate transport of dredged material for the purpose of ocean disposal
Types of Authorizations

- **General Permits:**
  - Have minimal impacts individually and cumulatively
  - Compliance with most laws and regulations occurs during development of permit, not permit verification
  - Nationwide Permits (NWPs)
  - Regional General Permits (RGPs)
  - State Programmatic General Permit (SPGPs)
Types of Authorizations (cont’d)

- Individual Permits
  - Letters of Permission (LOPs)
    - Not controversial
    - No public notice
  - Standard Individual Permits (SIPs aka IPs)
    - Complex, can be controversial
    - Can require District Commander involvement
  - Compliance with laws and regulations occurs during a case-specific analysis
Nationwide Permit #12 Utility Lines

- Construction, maintenance, or repair of utility lines, substations, access roads, etc.

- \( \frac{1}{2} \) acre of total loss of waters of the U.S. (impacts such as conversion to different wetland types and temporary impacts that are fully restored do not constitute loss)

- Single and complete crossings of waters
NWP #12 - Reporting

- **Required When:**
  - activity involves mechanized land clearing in a forested wetland for the utility line right-of-way;
  - a Section 10 permit is required;
  - the utility line in waters of the United States, excluding overhead lines, exceeds 500 feet;
  - the utility line is placed within a jurisdictional area (i.e., water of the United States), and it runs parallel to or along a stream bed that is within that jurisdictional area;
NWP #12 – Reporting (cont’d)

- Required When:

  - discharges occur that result in the loss of greater than 0.1-acre of waters of the United States;
  - permanent access roads are constructed above grade in waters of the United States for a distance of more than 500 feet; or
  - permanent access roads are constructed in waters of the United States with impervious materials

- NOTE: many districts have imposed additional reporting requirements in certain situations—check with the appropriate district(s)
Schematic Scope of Analysis
Diagram for Single and Complete Navigable Waterbody Crossing
Scope of Analysis for Multiple Linear Project Crossings

Waters of U.S. < 1 mile
Project Segment = 5 miles
- 3 Permit Areas

Waters of U.S. = 3 miles
Project Segment = 5 miles
- 1 Permit Area
Individual Permits

- Public Notice
- National Environmental Policy Act
- Public Interest Review
- Clean Water Act Section 404(b)(1) Guidelines*
- Other Laws and Regulations

* If applicable (i.e. discharge of fill)
Keys to Timely Decisions

- Understand and comply with USACE information requirements
- Respond to questions/comments/info requests in a timely manner
- Closely engage with USACE even when we are not the lead federal agency (do not wait until lead agency makes a decision!)
- If you are ever unsure about what’s required or why, please ask
Other - Section 408

- Modification or alteration of a Corps project (e.g. levees, navigation channels, etc).
- Managed by other business lines within the agency
- Regulatory will not render a permit decision unless/until a Section 408 permission is granted
Questions
Carl Zichella, 
Director of Regional Transmission, NRDC
Expediting Renewable Transmission

NARUC Winter Meeting, New York City

CARL ZICHELLA
DIRECTOR OF REGIONAL TRANSMISSION
NRDC
JULY 15, 2015
Presentation Overview

Renewable Energy Transmission Challenges
The Role of Public Participation
Making the case for Need
Timing
Use planning tools to avoid conflict
Summary
Renewable Transmission Challenges

- Remotely constrained
- Lengthy transmission
- Fragmented Transmission Authorities
- Generation v. Transmission Time Horizons
- Public v. Private Lands
- ROW’s are precious and difficult to create
Environmental Priorities

Transmission for Renewables
Maximum Use of Existing ROWs
Maximum Use of Existing Transmission
Make the case for need
Use Geospatial Analysis to Avoid Risks
Making the Case for Need

- System analytics
  - Congestion
  - Reliability
  - System utilization
- Non-wires analysis
- Responsive to policy goals
  - RPS
  - Clean Power Plan compliance
Role of Public Participation

Help Avoid Stakeholder Conflict
Accelerate Low Carbon Res. Penetration
Help Identify Fatal Flaws for Projects
Find Solutions to Routing and Siting
  • Provide meaningful comparisons between alternatives and help guide choices
Build Support for Solutions within Classes of Stakeholders
Timing Issues – Start Early

Classic Planning:
- Lay out route, submit for Environmental Review, Consult Public

Smart From the Start Planning:
- Consult key stakeholders early
- Use feedback to inform routing decisions
- Open and Transparent throughout
- Avoids risk of environmental and cultural conflicts
Early Consults Help Reduce Conflict

Numerous projects now practice Smart from the Start Planning to avoid conflicts

• Transwest Express
• Zephyr
• Sun Zia
• Gates to Gregg (California)
Planning tools to avoid conflict

What Are “Risk Classifications?”

General Session

Strategies for Expediting Power Line Transmission and Gas Pipeline Siting
