

# CONSIDERING NON-ENERGY BENEFITS IN PUC DECISION MAKING: WHAT COUNTS?

NARUC CENTER FOR PARTNERSHIPS & INNOVATION WEBINAR SERIES JANUARY 20, 2022

### ABOUT NARUC

- The National Association of Regulatory Utility Commissioners (NARUC) is a nonprofit organization founded in 1889.
- Our Members are the state utility regulatory Commissioners in all 50 states & the territories. FERC & FCC Commissioners are also members. NARUC has Associate Members in over 20 other countries.
- NARUC member agencies regulate electricity, natural gas, telecommunications, and water utilities.

### **ABOUT NARUC'S CENTER FOR PARTNERSHIPS & INNOVATION**

- Grant-funded team dedicated to providing technical assistance to members.
- CPI identifies emerging challenges and connects state commissions with expertise and strategies to inform their decision making.
- CPI builds relationships, develops resources, and delivers trainings.

Regularly updated CPI fact sheet with recent publications & upcoming events under Quick Links at:

https://www.naruc.org/cpi-1/

- Defining Non-Energy Impacts (NEIs)
- NEI categories and their use in program analysis
- Importance of NEIs for regulators
- Determining NEI values

### **Policy and Program Impacts - Overall Context for NEIs**

- Regulators support utility programs that:
  - Align with their jurisdiction's policies, goals and regulations
  - Are considered cost-effective investments
- Various analysis methods are used to determine cost-effectiveness, but the basic concept is to compare impacts of different options – e.g., using benefit-cost analysis
- Traditionally, policy and program impacts have been categorized into three groupings of costs and benefits: Utility System, Participant, and Societal

### **Defining Non-Energy Impacts**

- NEIs is a broad term for a wide range of costs and benefits that are not clearly associated with energy generation, transmission, and distribution (GT&D).
- NEIs can be defined as:
  - Costs All costs beyond those associated with directly implementing energy programs
  - Benefits All utility system, participant, and societal benefits beyond those directly associated with the utility system's provision of GT&D
- In practice, definitions of specific NEIs vary, in part depending on context, with some potential for overlap between energy and non-energy impacts
- What is most important is not necessarily getting impacts into the right "bucket," but considering all substantive impacts as long as they are:
  - Connected to a jurisdiction's policies or regulations
  - Relevant to cost-effectiveness analyses

### **NEI Resources**

- Berkeley Lab reviewed how 30 jurisdictions calculate and use NEIs
   <u>https://emp.lbl.gov/publications/applying-non-</u> energy-impacts-other
- We looked at 16 categories of NEIs
  - Focused on methods to calculate NEIs for energy efficiency programs, particularly use of other jurisdictions' values
  - Documented multiple resources with NEI calculations and values
  - Did not cover low-income NEIs these have been well studied by others (see references in our report)
- Julie Michals (next presentation) will describe another resource:

https://www.nationalenergyscreeningproject.org/ state-database-dsp/

Applying Non-Energy Impacts from Other Jurisdictions in Cost-Benefit Analyses of Energy Efficiency Programs: Resources for States for Utility Customer-Funded Programs

Mary Sutter<sup>1</sup>, Jenn Mitchell-Jackson<sup>1</sup>, Steven R. Schiller<sup>2</sup>, Lisa Schwartz<sup>2</sup>, and Ian Hoffman<sup>2</sup>

<sup>1</sup>Grounded Research and Consulting, LLC <sup>2</sup>Electricity Markets and Policy Department, Berkeley Lab

The work described in this study was supported by the U.S. Department of Energy's (DOE) Building Technologies Office under Lawrence Berkeley National Laboratory Contract No. DE-AC02-05CH1231.

### **Commonly Applied NEIs (1)**

#### - from 2020 Berkeley Lab Report

| Percent of<br>Jurisdictions<br>Using NEI<br><i>(N</i> =30) | Non-Energy Impact<br>Category  | Definition  |
|--|--|---|
| 60%  | Water resource costs<br>and benefits (participant<br>benefit)                  | Costs and benefits associated with changes in water consumption and wastewater treatment resulting from efficiency resources  |
| 53%  | Other fuels costs and benefits (participant benefit)                           | Costs and benefits resulting from reduced consumption of electricity and non-<br>electric energy sources, or from increased consumption of other fuels,<br>resulting from energy efficiency           |
| 47%  | Avoided environmental<br>compliance costs (utility<br>impact)                  | Reduction in future costs of complying with environmental regulations from efficiency, which reduces the amount of energy that needs to be generated  |
| 43%  | Environmental impacts (societal impact)  | The range of environmental costs and benefits that result from efficiency resources   |
| 37%  | Productivity (participant impact)  | Includes changes in labor costs and productivity, waste streams,<br>spoilage/defects, operations and maintenance, and changes in product sales<br>as a result of changes in aesthetics, comfort, etc. |
| 33%  | Health and safety (participant impact)   | Includes improved "well-being" due to reduced incidence of illness, medical costs, sick days, deaths, and insurance costs (e.g., from reduced fire risk)  |
| 30%  | Asset value (participant benefit)  | Includes equipment functionality/performance improvement, equipment life extension, change in building value, change in ease of selling building  |
| 30%  | Energy and/or capacity<br>price suppression<br>effects <i>(utility impact)</i> | Reduced market clearing prices resulting from efficiency resources; may<br>extend outside service territory because of regional nature of wholesale<br>markets  |
| KNI TAR  | ENERGY TECHNOLOGIES AREA   | ENERGY ANALYSIS AND ENVIRONMENT AL IMPACT S DIVISION ELECT RICIT Y MARKET S & POLICY 7  |

### **Commonly Applied NEIs (2)**

| Percent of<br>Jurisdictions<br>Using NEI<br><i>(N=30)</i> | Non-Energy Impact<br>Category   | Definition  |
|---|---|---|
| 27%   | Avoided costs of<br>compliance with RPS<br>requirements <i>(utility</i><br><i>impact)</i> | Reduction in absolute amount of renewable resources that mustbe purchased resulting from efficiency   |
| 23%   | Avoided credit and collection costs (utility impact)                                      | Value of reduced probability of customers falling behind or defaulting on bill payment obligations as a result of lowered energy use and customer energy bills from efficiency programs               |
| 23%   | Avoided ancillary services (utility impact)   | Value of reduction in services required to maintain electric grid stability and security  |
| 23%   | Comfort (participant<br>impact)   | Includes thermal comfort, noise reduction, improved light quality   |
| 20%   | Economic development<br>and job impacts (societal<br>impact)                              | The economic development and jobs that are associated with investment in energy efficiency including job creation and increases in disposable income resulting from energy bill savings for customers |
| 13%   | Public health impacts (societal impact)   | The range of public health impacts resulting from efficiency resources  |
| 10%   | Energy security impacts (societal impact)   | The impacts on energy security and energy independence resulting from<br>energy efficiency investments  |
| 7%  | Increased reliability (utility impact)  | Value of reduced probability and/or likely duration of customer service interruptions from efficiency, which lowers loads on the grid   |

# Can NEIs Move the Needle in Cost-Effectiveness Analysis? Yes!

- NEIs can be positive (reduce costs/increase benefits) or negative (increase costs/reduce benefits).
- However, virtually all recognized NEIs for distributed energy resources (DERs) provide positive impacts (i.e., benefits).
- Specific NEI values vary substantially between types of NEIs and from one jurisdiction to another.
- Reviewed studies indicate that NEIs can have negligible to substantial effects on cost-effectiveness calculations.
- For example, for energy efficiency, the national average cost to save a kilowatt-hour (kWh) is about 2.5 cents, according to the most recent <u>Berkeley Lab study</u>.
  - In some jurisdictions, the value of an individual NEI can offset close to half of that cost (e.g., one study showed about 1 cent/kWh for public health or increased reliability benefits).
  - Or an individual NEI may have minimal value for a jurisdiction (e.g., about 0.05 cent/kWh for Renewable Portfolio Standard compliance in another study).

### **NEIs Are Important for Regulators**

- □ We typically focus on energy and cost savings in assessment of projects and programs.
- However, regulators (and policy makers, utilities and consumers) often consider NEIs in decisions to pursue program investments because they can meet a variety of goals and objectives beyond pure energy concerns—for example, economic development, environmental management, public infrastructure reliability/resilience, and social/economic equity goals.
- □ Thus, cost-effectiveness tests and use of NEIs should:
  - Account for a jurisdiction's applicable policy goals and objectives
  - Avoid bias by treating benefits and costs symmetrically for any given type of impact (pr example, include consumer benefits if including consumer costs)
  - Include all relevant material impacts, including those tat are difficult to quantify or monetize
- In addition, understanding and quantifying NEIs supports program design and marketing of efficiency and other DER programs by addressing the non-energy interests of participants, utilities and others – which can often be stronger motivators than energy cost savings alone.

### **Determining NEI Values**

- Benefits and costs of DER investments may be estimated with:
  - Monetary or non-monetary quantitative terms, or
  - Qualitative values.
- Using current, monetary values that are specific to the given jurisdiction are the best approach, providing for accurate and consist comparison of options.
- However, some impacts are hard to monetize, and jurisdictions can face constraints to conducting rigorous jurisdiction-specific impact studies.
- Thus, some jurisdictions choose to apply other approaches

   such as applying values from other jurisdictions, using broad adders applied to energy benefits, or taking into consideration qualitative factors.
- While many of these approaches represent approximations and include some uncertainties, it is better to use the best available approximation for a material impact than to assume it does not exist or that its value is zero.

### **Five Approaches to Valuing NEIs**

The National Standard Practice Manual (NSPM) defines five approaches to account for relevant impacts, including approaches for hard-to-monetize NEIs.

| Monetary Approaches  |  |  |  |  |  |
|--|--|--|--|--|--|
| Jurisdiction-specific studies  | Rigorous jurisdiction-specific studies on DER impacts offer the potentially most accurate approach for estimating and monetizing relevant impacts.                       |  |  |  |  |
| Studies from other jurisdictions   | If jurisdiction-specific studies are not available, studies from other jurisdictions or regions, or national studies, can be used for estimating and monetizing impacts. |  |  |  |  |
| Proxies  | If monetized impacts are not available, well-informed and well-<br>designed proxies can be used as a simple substitute (e.g., %adders).                                  |  |  |  |  |
|  | Non-Monetary Approaches  |  |  |  |  |
| Alternative thresholdsPre-determined thresholds — e.g., benefit-cost ratios that are different from one (1.0) — can be used as a simple way to account for relevant impacts that are not otherwise included. |  |  |  |  |  |
| Qualitative values   | Relevant qualitative information can be used to estimate impacts that cannot be monetized.   |  |  |  |  |

### **Using Alternative Benchmarks and Proxies**

- Alternative thresholds allow DERs to be considered cost-effective at pre-determined benefit-cost ratios that are different from one (1.0).
- Applying a proxy value can essentially have the same effect as using alternative benchmarks.
- Several types of proxies can be used to account for impacts.
  - Percentage "Blanket" Adder: A percentage adder approximates the value of nonmonetized impacts by scaling up all impacts that are monetized. This type of proxy is the simplest and easiest to apply, but is a blunt tool. Several states apply this approach.
  - Energy Savings Multiplier (\$/MWh or \$/MMBtu or X%): A savings multiplier approximates the value of non-monetized benefits or costs relative to the quantity of energy savings. For example, increasing value of benefits by 50 cents per MWh saved or by 10% of the value of the energy savings.
  - Customer Adder (\$/customer): A customer adder (or subtraction) approximates the value of non-monetized benefits relative to the number of customers served by a program.
  - Measure Multiplier (\$/measure): A fixed dollar amount adder — for example, \$X.X per PV system

### **Considering Qualitative Values**

- Distinguish between whether and how to include an an impact.
  - First decide *whether* to include impacts in costeffectiveness tests based on the relevant policies, goals, regulations, and relevance of specific NEIs. Then decide separately *how* to value or otherwise account for the impacts.
  - Provide as much quantitative evidence as possible.
  - Establish metrics to create quantitative data for future analyses that can result in quantitative values.
  - Provide as much qualitative evidence as practical.
- Decide on the implications of the quantitative and qualitative evidence.
  - Non-monetized impacts are presented alongside monetary impacts so regulators can compare the monetized, quantitative, and qualitative factors and evidence to decide whether a program is appropriate.
  - Document and justify the decision.

### **NEIs** — Summary

- Non-energy impacts of energy efficiency are impacts not directly, or commonly recognized as, associated with energy production, transmission, and distribution.
- While often more difficult to quantify than direct energy impacts, there are multiple sources and methods for determining NEI values.
- On balance, researchers have found that NEIs have positive impacts for utility systems, consumers, and society, sometimes representing substantial benefits — for example, with respect to air quality and public health.
- Considering whether and how to include NEIs is an important component of cost-benefit analyses, potentially leading to acquisition of more cost-effective energy choices than otherwise would be achieved.
- It is better to use the best available approximation for a material impact than to assume it does not exist or that its value is zero.

### State Consideration of Non-Energy Impacts in Cost-Effectiveness Testing

### NARUC Center for Policy Innovation Webinar

Julie Michals – E4TheFuture January 20, 2022

### About NESP

**The National Energy Screening Project (NESP)** is a stakeholder organization that is open to all organizations and individuals with an interest in working collaboratively to improve cost-effectiveness screening practices for energy efficiency (EE) and other distributed energy resources (DERs).

Products include:

- NSPM for EE (2017)
- NSPM for DERs (2020)
- Database of Screening Practices (DSP)

NESP work is managed by E4TheFuture, with coordinated state outreach via key partners.

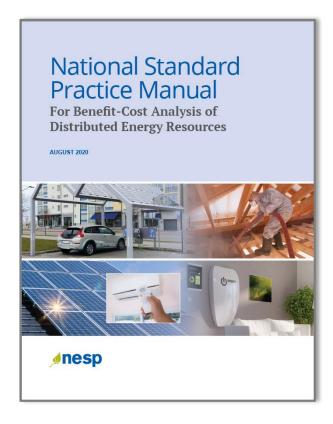

NESP work is funded by E4TheFuture and in part by US DOE.

https://nationalenergyscreeningproject.org/

### NSPM for DERs Principles (and why they matter in context of NEIs...)

- 1. Recognize that DERs can provide energy/power system needs and should be <u>compared with other</u> <u>energy resources</u> and treated <u>consistently</u> for BCA.
- 2. Align primary test with jurisdiction's <u>applicable policy</u> <u>goals</u>.
- 3. Ensure symmetry across costs and benefits.
- 4. Account for all <u>relevant, material impacts</u> (based on applicable policies), even if hard to quantify.
- 5. Conduct a <u>forward-looking</u>, <u>long-term analysis</u> that captures incremental impacts of DER investments.
- 6. Avoid <u>double-counting</u> through clearly defined impacts.
- 7. Ensure <u>transparency</u> in presenting the benefit-cost analysis and results.
- 8. Conduct <u>BCA separate from Rate Impact Analyses</u> because they answer different questions.

### Host Customer Impacts

Does policy require that you account for Host Customer Impacts? If so, is there symmetry in treatment of benefits and costs?

| Host Customer<br>Impact      | Description  |  |  |  |
|------------------------------|--|--|--|--|
| Host portion of<br>DER costs | Costs incurred to install and operate DERs   |  |  |  |
| Interconnection<br>fees      | Costs paid by host customer to<br>interconnect DERs to the grid  |  |  |  |
| Risk                         | Uncertainty including price volatility,<br>power quality, outages, and operational<br>risk related to failure of installed DER<br>equipment and user error; this type of<br>risk can depend on the type of DER |  |  |  |
| Reliability                  | The ability to prevent or reduce the duration of host customer outages   |  |  |  |
| Resilience                   | The ability to anticipate, prepare for,<br>and adapt to changing conditions and<br>withstand, respond to, and recover<br>rapidly from disruptions  |  |  |  |
| Tax incentives               | Federal, state, and local tax incentives provided to host customers to defray the costs of some DERs   |  |  |  |
| Non-energy<br>Impacts (NEIs) | Benefits and costs of DERs that are<br>separate from energy-related impacts<br>low- or limited-income customers<br>market rate customers   |  |  |  |

| Host<br>Customer NEI     | Description  |
|--------------------------|--|
| Transaction costs        | Costs incurred to adopt DERs, beyond those related to installing or operating the DER itself (e.g., application fees, customer time spent researching DERs, paperwork, etc.)   |
| Asset value              | Changes in the value of a home or business as a result of the DER<br>(e.g., increased building value, improved equipment value,<br>extended equipment life)                    |
| Productivity             | Changes in a customer's productivity (e.g., in labor costs, operational flexibility, reduced waste streams, reduced spoilage)  |
| O&M                      | Changes in O&M costs (e.g., less frequent change out of light bulbs,<br>lower O&M for EVs relative to combustion engine vehicles, etc.)  |
| Economic well-<br>being  | Economic impacts beyond bill savings (e.g., reduced complaints about bills, reduced terminations and reconnections, reduced foreclosures—especially for low-income customers)  |
| Comfort                  | Changes in comfort level (e.g., thermal, noise, and lighting impacts)  |
| Health & safety          | Changes in customer health or safety (e.g., fewer sick days from<br>work, reduced medical costs, improved indoor air quality, reduced<br>deaths)                               |
| Empowerment & control    | Ability to control one's energy consumption and energy bill  |
| Satisfaction & pride     | Satisfaction of helping to reduce environmental impacts (e.g., key reason why residential customers install rooftop PV)  |
| Power/ Quality           | Ability of electrical equipment to consume the energy being supplied to it e.g., improved electrical harmonics, power factor, voltage instability and efficiency of equipment. |
| DER Integration          | Ability to add current and future DERs to the existing electric energy grid.   |
| Reduced Utility<br>Bills | Only relevant if using a Participant Cost Test   |

### Accounting for Host Customer NEIs (and Symmetry Challenge)

NESP Database of Screening Practices

### Another way to achieve symmetry: New Hampshire's Granite State Test\*

\*NH Granite State Test developed using the NSPM BCA Framework – approved by NH PUC in 2020 but then PUC rejected 3-year EE settlement plan (now being contested)

### Accounting for Societal Impacts

Does policy articulate specific societal goals with investing in DER(s)? If so, they should be accounted for, even if hard to quantify.

| Societal Impact                                  | Description  |  |  |  |  |  |
|--|--|--|--|--|--|--|
| Resilience                                       | Resilience impacts beyond those experienced by utilities or host customers   |  |  |  |  |  |
| GHG Emissions                                    | GHG emissions created by fossil-fueled energy resources (beyond GHG compliance costs accounted for as utility system impact) |  |  |  |  |  |
| Other Environmental                              | Other air emissions, solid waste, land, water, and other environmental impacts   |  |  |  |  |  |
| Economic and Jobs                                | Economic development and job impacts (direct/indirect, net)  |  |  |  |  |  |
| Public Health                                    | Health impacts, medical costs, and productivity affected by health   |  |  |  |  |  |
| Low Income or Vulnerable<br>Populations: Society | Poverty alleviation, environmental justice, reduced home foreclosures, etc.  |  |  |  |  |  |
| Energy Security                                  | Energy imports and energy independence   |  |  |  |  |  |
| Teat 9 April                                     | estion Utility System Non Utility System Impact Symmetry Impact Matheda  |  |  |  |  |  |
| ates Single State Test & Appli                   | cation Utility System Non-Utility System Impacts Impacts Impacts   |  |  |  |  |  |

| Category | Field                         | # States = |
|----------|-------------------------------|------------|
| Societal | Environmental                 | 14         |
| Impacts  | Economic Development and Jobs | 3          |
|          | Energy Security               | 1          |

### Accounting for GHG Emission Impacts

Are *existing* and *anticipated* compliance costs accounted for?

Are the jurisdiction's (or utility) carbon reduction goals accounted for (beyond compliance)?

Discount rate matters (a lot)!

| State | Does state account for cost of carbon in its CE test?      |   |  |  |  |
|-------|--|---|--|--|--|
|       | Environmental Compliance<br>As Avoided Utility System Cost | Societal Benefit or<br>Externality (beyond compliance<br>costs) |  |  |  |
| CA    | Yes<br>(cap and trade)                                     | Yes – using GHG adder   |  |  |  |
| со    | No<br>(set at \$0)   | Yes<br>in sensitivity analysis of BCA                           |  |  |  |
| СТ    | Yes<br>RGGI compliance                                     | Yes – but in secondary test only                                |  |  |  |
| IL    | Yes  | Yes   |  |  |  |

| 2040              | 25                          | 73            | 103             | 225                               |  |  |
| 2045              | 28                          | 79            | 110             | 242                               |  |  |
| 2050              | 32                          | 85            | 116             | 260                               |  |  |

Source: Interim Estimates under Executive Order 13990 Interagency Working Group (IWG) on Social Cost of Greenhouse Gases, US Government

#### MA Example:

Social Cost of Carbon used from 2021 AESC = **\$128/ton** for 15-year levelized using 2% discount rate.

New recommendation for utility 3-year EE plans uses 1% discount rate = **\$393/ton** 

See: <u>https://www.synapse-</u> <u>energy.com/project/aesc-2021-</u> <u>supplemental-study-update-social-cost-</u> <u>carbon-recommendation</u>

### Public Health Benefits

- Often articulated as a policy goal for EE and other DER investments
- EPA Benefits per KWH (BPK) Tool
  - Based on AVERT and COBRA models
  - Example: IL Societal Health NEIs report (Revised April 2021) Ameren

| Sector             | Verified Savings<br>(GWh) | Verified Savings<br>(Thousand<br>Therms) |         | ealth Benefits<br>2018 \$) | Illinois Only Health<br>Benefits<br>(Million 2018 \$) |         |
|--------------------|---------------------------|--|---------|----------------------------|---|---------|
|                    |                           |  | Low     | High                       | Low   | High    |
| Electric           | 3,571                     | NA                                       | \$89.53 | \$201.86                   | \$11.83   | \$26.65 |
| Residential Gas    | NA                        | 13,819                                   | \$0.56  | \$1.26                     | \$0.19  | \$0.42  |
| Nonresidential Gas | NA                        | 35,417                                   | \$1.64  | \$3.71                     | \$0.55  | \$1.23  |
| Gas Subtotal       | NA                        | 49,236                                   | \$2.20  | \$4.97                     | \$0.73  | \$1.65  |
| Portfolio Total    | 3,571                     | 49,236                                   | \$91.73 | \$206.82                   | \$12.56   | \$28.30 |

Table 2. AIC 2018 Energy Efficiency Portfolio Lifetime Societal Health Benefits

- Emission rates behind models can make a difference: marginal (short-term vs long-term) or average emission rates?
  - AVERT Model uses marginal short-term rate
  - Cambium Model (NREL) uses marginal long-term rate

### **Other Key Societal Impacts**

Other NEIs are often articulated in state policy goals but not accounted for in BCA. For example:

- Economic development not monetized in BCA but separate quantitative analysis that can be part of decision-making process:
  - 3 jurisdictions: NV, DC and RI quantify impacts using either proxies (e.g., adders), multipliers, or input-output models (or some combination thereof).
  - See ACEEE report: <u>Guidance On Developing Economic Benefits for Energy</u>
     <u>Efficiency</u>
- Resilience (societal) qualitative assessment?
- Energy security qualitative assessment?

**NSPM Principle:** If impact is an applicable goal, but hard to quantify, even some level of qualitative assessment is important to consider in decisionmaking, because the impact **value is not zero** 

### Accounting for Energy Equity

Procedural Practices (planning metrics) Community engagement and representation in the utility and regulatory decision-making processes; data/metrics reporting; etc. Equity Analysis (distributional metrics for target populations)

Rate impacts, bill impacts, energy burden, participation rates AND distributional analysis of societal impacts (energy resilience, energy reliability, public health, environmental, jobs, community wealth, etc.)

ENERGY

EQUITY

Traditional BCA (system avg info)

Utility System and Other Fuel Impacts

Host Customer Impacts

Societal Impacts

Can indicate costs and benefits for programs designed to serve target populations.

### NEIs – Across different DERs

Impact can be a benefit or cost or will 'depend' on key factors

| Туре             | Host Customer Impact      | EE | DR | DG | Storage | Electrification |
|------------------|---------------------------|----|----|----|---------|-----------------|
| Host<br>Customer | Host portion of DER costs | •  | •  | •  | •       | •               |
|                  | Interconnection fees      | 0  | 0  | •  | •       | 0               |
|                  | Risk                      | •  | 0  | •  | •       | •               |
|                  | Reliability               | •  | •  | •  | •       | •               |
|                  | Resilience                | •  | •  | •  | •       | •               |
|                  | Tax Incentives            | •  | •  | •  | •       | •               |
|                  | Host Customer NEIs        | •  | •  | •  | •       | •               |
| (                | Low-income NEIs           | •  | •  | •  | •       | •               |
|                  |                           |    |    | -  |         |                 |
| Туре             | Societal Impact           | EE | DR | DG | Storage | Electrification |
|                  | Resilience                | •  | •  | ٠  | •       | •               |
|                  | GHG Emissions             | •  | •  | •  | •       | •               |
|                  | Other Environmental       | •  | •  | •  | •       | •               |
| Societal         | Economic and Jobs         | •  | •  | •  | •       | •               |
|                  | Public Health             | •  | •  | •  | •       | •               |
|                  | Low Income: Society       | •  | •  | •  | •       | •               |

• = typically a benefit for this resource type; • = typically a cost for this resource type; • = either a benefit or cost for this resource type, depending upon the application of the resource;  $\circ$  = not relevant for this resource type

### \*NEW\* Methods, Tools & Resources A Handbook for Quantifying DER Impacts for BCA

**Coming February 2022** – The MTR Handbook is a companion resource to the NSPM, providing guidance on methods for calculating:

- Full range of utility system impacts (electric, gas, and other fuels)
- Non-utility system impacts (host customer and societal)
- Risk and uncertainty
- Reliability and resilience
- Developing DER Load Impact/Operating Profiles
- Offers pros and cons of different methodological approaches;
- Provides public resources to develop BCA inputs

### Thank you!

### Maryland Electric Vehicle Benefit/Cost Framework: An Example Of Non-Energy Impact Consideration

January 20, 2022

Mark Warner Vice President Advanced Energy Solutions Gabel Associates, Inc.

### NARUC Innovation Webinar: Background

- Multiple Utilities In Maryland Offer Specialized Programs To Support EV Market Growth
- The Maryland Public Service Commission (PSC) Requires Formal Benefit/Cost Analysis For EV Program Filings; In 2019/2020, Several Utilities Including BCA In Their Multi-Year Filings
- In December 2020, The PSC Chartered A Year-Long Stakeholder Group To Define A Formal BCA Methodology Specifically For Utility EV Programs (Order 89678)
- Working Group Considered Multiple Sources: Prior Testimony, EV-BCA Examples From Other Jurisdictions, MD-EmPower Program, National Standards Practice Manual (NSPM)
- The Working Group Achieved Consensus On A Comprehensive EV-BCA Framework, Which Was Approved Unanimously By The PSC On January 12, 2022 (Case #9478)
- The EV-BCA Framework Has Been Described In Detail In A Whitepaper That Will Be Available As Part Of This Webinar
- The MD EV-BCA Framework Incorporates Detailed Consideration Of "Non-Energy Impacts" (NEIs) Since <u>These Impacts Are A Primary Motivation For Widespread EV Adoption</u>.

- The EV-BCA Framework Defines Methodology At THREE LEVELS:
  - > An Overall Assessment Strategy (which assessments are used, and why)
  - > High Level Inventory Of Benefits and Costs (at a generic level)
  - > Detailed Calculation Methods And Sources Specific To EV Impacts (detailed offer maps)
- Ensuring Fair Consideration Of EV-Specific Impacts
  - > Net Changes In Emissions (societal impacts: both Climate Change and Public Health)
  - > Net Changes In Economics For EV-Owners (participant impacts)
  - > Net Changes In Aggregate Load And Utility Costs (utility impacts)
- The Nature Of EV-Impacts:
  - > Inherently A Fuel-Switching Strategy (displaces vehicle-fuel use with electricity use)
  - > Increases electricity use (but increases overall efficiency of primary fuel use)
  - > Can Have Significant, But Potentially Managed, Impact On Load
- The Framework Informs Multiple Stakeholder Groups:
  - Guides Utility Program Design
  - Quantifies "Cost Effectiveness" In A Rigorous Way
  - > ALSO Addresses Ratepayer Impacts

All Three Perspectives Are Of Interest To Policy Decision-Makers

• Significant "Boundary Condition" Assumptions Needed For All Impacts, Especially NEIs

### NARUC Innovation Webinar: EV-BCA Framework

#### Five-Part Framework To Provide Multiple Policy-Perspectives:

#### Primary Test: MD-EV-JST

- Societal scope
- Considers only impacts induced by the proposed utility programs
- Based on a standard NPV of benefits divided by the NPV of costs
- Two variations: a BCA for each individual utility program, and the aggregate impact of the program portfolio

#### Secondary Test (MW): Market-Wide Societal Impact

- Societal scope, similar to a standard SCT (although not exactly the same)
- Considers full market impacts (all vehicle on the road), including the proposed utility programs (as a portfolio)
- Three variations: full natural charging, full managed charging, likely charging outcome

#### Secondary Assessment (ANRI-All): Ratepayer Impacts – All Impacts

- A customized test (ANRI) that quantifies aggregate net impact on non-participating ratepayers
- Based on NPV of ratepayer cost increases and decreases
- Considers both "changes on the utility bill" and externalities such as climate change and public health
- Two variations: an assessment for each individual utility program, and the aggregate impact of the program portfolio
- Express all ANRI results in two forms: total net NPV (positive or negative), and an illustrative "monthly impact per residential customer" indicator.

#### Secondary Assessment (ANRI-Bill Only): Ratepayer Impacts – Bill Impacts Only

• Same as above, but considers economized impacts on the bill only

#### **Other Strategic Considerations**

• A qualitative inventory of relevant impacts that are important, but hard to quantify credibly

An "Impact" Could Be A Benefit Or A Cost (for SCT-Style Tests), Or Drive An Increase OR A Decrease In Net Utility Costs (for ANRI Tests).

| Impact-Factor   | MD EV-JST       | MW-Test         | ANRI (AII)           | ANRI (Bills Only)    |

### NARUC Innovation Webinar: Including NEIs

- Including NEIs Was CRITICAL To Fairly Representing EV-BCA Outcomes:
  - > Achieving Non-Energy Net-Benefit Are Part Of Maryland Policy Goals
  - > They Are An Essential Part Of Representing EV-Impacts Fairly
- Innovations In The Framework To Make Sure NEIs Are Properly Represented:
  - Jurisdiction Specific Test (JST) Is Societal In Scope (some externalities considered)
  - Market-Wide SCT Assessment (considers potential full market impacts)
  - Non-Participating Ratepayer Impact With Externalities (climate change, public health)

#### • NEIs Included In EV-BCA:

- Impacts Due To Changes In Load Shape (and clearing prices)
- Changes in RPS-compliance costs
- Emissions Reductions (including both climate change and public health reasons)
- Changes in participant economics

#### • Other NEIs Considered, But Not Included (Challenges With Computational Methods)

- Strategic Value Of Reduced Petroleum Use
- Changes In Risk
- Changes In Resilience (& Reliability)
- Changes In Security
- Impact On Water Use
- Impact On Attainment Of MD-Policy Goals

#### **Others Possible, But Not Considered:**

- 1) Equity Impacts
- 2) Economic Development
- 3) Changes in Safety
- 4) Power Quality

### NARUC Innovation Webinar: Thank You

- Contact
  - > Mark Warner, Vice-President
  - Gabel Associates
  - mark@gabelassociates.com
- Acknowledgements: the working group effort in Maryland benefit from numerous stakeholders, including PSC staff, the Office of People's Council, other state agencies, representatives from the EV-charging industry, independent subject-matter experts, other independent stakeholders, and the MD Joint Utilities (BGE, PEPCO, DPL, PE, and SMECO)

# NARUC Innovation Webinar series

One Thursday each month, 3-4pm ET

All NARUC members and stakeholders are invited

### Black Start Considerations in a Highly Renewable Supply Future

• February 24, 2022 | 3:00 - 4:00 PM Eastern

Spring webinar dates: March 17, April 21, May 19

Topics and more webinar information will be added soon! <u>https://www.naruc.org/cpi-1/innovation-webinars/</u>

NARUC thanks the U.S. Department of Energy for its support of this series.
